Y = no_of_Issues X = Security

Run Summary Section

Parameter	Value	Parameter	Value
Dependent Variable	no_of_Issues	Rows Processed	10
Independent Variable	Security	Rows Used in Estimation	10
Frequency Variable	None	Rows with X Missing	0
Weight Variable	None	Rows with Freq Missing	0
Intercept	2921.9637	Rows Prediction Only	0
Slope	15.2002	Sum of Frequencies	10
R-Squared	0.7898	Sum of Weights	10.0000
Correlation	0.8887	Coefficient of Variation	0.0531
Mean Square Error	77004.04	Square Root of MSE	277.496

Summary Statement

The equation of the straight line relating no_of_Issues and Security is estimated as: no_of_Issues = (2921.9637) + (15.2002) Security using the 10 observations in this dataset. The y-intercept, the estimated value of no_of_Issues when Security is zero, is 2921.9637 with a standard error of 429.0459. The slope, the estimated change in no_of_Issues per unit change in Security, is 15.2002 with a standard error of 2.7721. The value of R-Squared, the proportion of the variation in no_of_Issues that can be accounted for by variation in Security, is 0.7898. The correlation between no_of_Issues and Security is 0.8887.

A significance test that the slope is zero resulted in a t-value of 5.4833. The significance level of this t-test is 0.0006. Since 0.0006 < 0.0500, the hypothesis that the slope is zero is rejected.

The estimated slope is 15.2002. The lower limit of the 95% confidence interval for the slope is 8.8077 and the upper limit is 21.5928. The estimated intercept is 2921.9637. The lower limit of the 95% confidence interval for the intercept is 1932.5820 and the upper limit is 3911.3454.

Regression Estimation Section

Parameter	Intercept B(0)	Slope B(1)
Regression Coefficients	2921.9637	15.2002
Lower 95% Confidence Limit	1932.5820	8.8077
Upper 95% Confidence Limit	3911.3454	21.5928
Standard Error	429.0459	2.7721
Standardized Coefficient	0.0000	0.8887
T Value	6.8104	5.4833
Prob Level (T Test)	0.0001	0.0006
Reject H0 (Alpha = 0.0500)	Yes	Yes
Power (Alpha = 0.0500)	1.0000	0.9974
Regression of Y on X	2921.9637	15.2002
Inverse Regression from X on Y	2309.2236	19.2447
Orthogonal Regression of Y and X	2311.3126	19.2309

Notes:
The above report shows the least-squares estimates of the intercept and slope followed by the corresponding standard errors, confidence intervals, and hypothesis tests. Note that these results are based on several assumptions that should be validated before they are used.

Estimated Model
(2921.96371438552) + (15.2002395090066) * (Security)

Correlation and R-Squared Section

Parameter	Pearson Correlation Coefficient	R-Squared	Spearman Rank Correlation Coefficient
Estimated Value	0.8887	0.7898	0.8720
Lower 95% Conf. Limit (r dist'n)	0.5649		
Upper 95% Conf. Limit (r dist'n)	0.9685		
Lower 95% Conf. Limit (Fisher's z)	0.5883		0.5374
Upper 95% Conf. Limit (Fisher's z)	0.9736		0.9694
Adjusted (Rbar)		0.7636	
T-Value for H0: Rho = 0	5.4833	5.4833	5.0377
Prob Level for H0: Rho = 0	0.0006	0.0006	0.0010

Notes:
The confidence interval for the Pearson correlation assumes that X and Y follow the bivariate normal distribution. This is a different assumption from linear regression which assumes that X is fixed and Y is normally distributed.

Two confidence intervals are given. The first is based on the exact distribution of Pearson's correlation. The second is based on Fisher's z transformation which approximates the exact distribution using the normal distribution. Why are both provided? Because most books only mention Fisher's approximate method, it will often be needed to do homework. However, the exact methods should be used whenever possible.

The confidence limits can be used to test hypotheses about the correlation. To test the hypothesis that rho is a specific value, say r0, check to see if r0 is between the confidence limits. If it is, the null hypothesis that rho = r0 is not rejected. If r0 is outside the limits, the null hypothesis is rejected.

Spearman's Rank correlation is calculated by replacing the orginal data with their ranks. This correlation is used when some of the assumptions may be invalid.

Summary Matrices

Index	X'X 0	X'X 1	X'Y 2	X'X Inverse 0	X'X Inverse 1
0	10	1515	52248	2.390529	-0.01511901
1	1515	239543	8067886	-0.01511901	9.979542E-05
2 (Y'Y)			2.759166E+08		
Determinant		100205			9.979542E-06

Variance - Covariance Matrix of Regression Coefficients

Tests of Assumptions Section

Assumption/Test	Test Value	Prob Level	Is the Assumption Reasonable at the 0.2000 Level of Significance?
Residuals follow Normal Distribution?			
Shapiro Wilk	0.9372	0.522647	Yes
Anderson Darling	0.3634	0.440627	Yes
D'Agostino Skewness	-0.9847	0.324765	Yes
D'Agostino Kurtosis	-0.1876	0.851176	Yes
D'Agostino Omnibus	1.0049	0.605059	Yes
Constant Residual Variance?			
Modified Levene Test	0.0380	0.850239	Yes
Relationship is a Straight Line?			
Lack of Linear Fit F(6, 2) Test	495.0686	0.002017	No

No Serial Correlation?
Evaluate the Serial-Correlation report and the Durbin-Watson test if you have equal-spaced, time series data.

Notes:
A 'Yes' means there is not enough evidence to make this assumption seem unreasonable. This lack of evidence may be because the sample size is too small, the assumptions of the test itself are not met, or the assumption is valid.
A 'No' means the that the assumption is not reasonable. However, since these tests are related to sample size, you should assess the role of sample size in the tests by also evaluating the appropriate plots and graphs. A large dataset (say N > 500) will often fail at least one of the normality tests because it is hard to find a large dataset that is perfectly normal.

Normality and Constant Residual Variance:
Possible remedies for the failure of these assumptions include using a transformation of Y such as the log or square root, correcting data-recording errors found by looking into outliers, adding additional independent variables, using robust regression, or using bootstrap methods.

Straight-Line:
Possible remedies for the failure of this assumption include using nonlinear regression or polynomial regression.
