Linear Regression Report

Dataset Untitled
 Y = no_of_Issues X = Security

Run Summary Section

Parameter	Value	Parameter	Value
Dependent Variable	no_of_Issues	Rows Processed	10
Independent Variable	Security	Rows Used in Estimation	10
Frequency Variable	None	Rows with X Missing	0
Weight Variable	None	Rows with Freq Missing	0
Intercept	1013.2914	Rows Prediction Only	0
Slope	29.0141	Sum of Frequencies	10
R-Squared	0.7566	Sum of Weights	10.0000
Correlation	0.8698	Coefficient of Variation	0.0927
Mean Square Error	36520.42	Square Root of MSE	191.1032

Summary Statement

The equation of the straight line relating no_of_Issues and Security is estimated as:
 $\text{no_of_Issues} = (1013.2914) + (29.0141) \text{ Security}$ using the 10 observations in this dataset. The y-intercept, the estimated value of no_of_Issues when Security is zero, is 1013.2914 with a standard error of 218.5527. The slope, the estimated change in no_of_Issues per unit change in Security, is 29.0141 with a standard error of 5.8180. The value of R-Squared, the proportion of the variation in no_of_Issues that can be accounted for by variation in Security, is 0.7566. The correlation between no_of_Issues and Security is 0.8698.

A significance test that the slope is zero resulted in a t-value of 4.9869. The significance level of this t-test is 0.0011. Since $0.0011 < 0.0500$, the hypothesis that the slope is zero is rejected.

The estimated slope is 29.0141. The lower limit of the 95% confidence interval for the slope is 15.5976 and the upper limit is 42.4305. The estimated intercept is 1013.2914. The lower limit of the 95% confidence interval for the intercept is 509.3079 and the upper limit is 1517.2749.

This report is for evaluation purposes only.

Regression Estimation Section

Parameter	Intercept B(0)	Slope B(1)
Regression Coefficients	1013.2914	29.0141
Lower 95% Confidence Limit	509.3079	15.5976
Upper 95% Confidence Limit	1517.2749	42.4305
Standard Error	218.5527	5.8180
Standardized Coefficient	0.0000	0.8698
T Value	4.6364	4.9869
Prob Level (T Test)	0.0017	0.0011
Reject H0 (Alpha = 0.0500)	Yes	Yes
Power (Alpha = 0.0500)	0.9808	0.9911
Regression of Y on X	1013.2914	29.0141
Inverse Regression from X on Y	676.3589	38.3474
Orthogonal Regression of Y and X	676.6616	38.3390

Notes:

The above report shows the least-squares estimates of the intercept and slope followed by the corresponding standard errors, confidence intervals, and hypothesis tests. Note that these results are based on several assumptions that should be validated before they are used.

Estimated Model

$(1013.29140791547) + (29.0140884233942) * (\text{Security})$

Correlation and R-Squared Section

Parameter	Pearson Correlation Coefficient	R-Squared	Spearman Rank Correlation Coefficient
Estimated Value	0.8698	0.7566	0.7988
Lower 95% Conf. Limit (r dist'n)	0.5075		
Upper 95% Conf. Limit (r dist'n)	0.9629		
Lower 95% Conf. Limit (Fisher's z)	0.5310		0.3403
Upper 95% Conf. Limit (Fisher's z)	0.9688		0.9504
Adjusted (Rbar)		0.7262	
T-Value for H0: Rho = 0	4.9869	4.9869	3.7555
Prob Level for H0: Rho = 0	0.0011	0.0011	0.0056

Notes:

The confidence interval for the Pearson correlation assumes that X and Y follow the bivariate normal distribution. This is a different assumption from linear regression which assumes that X is fixed and Y is normally distributed.

Two confidence intervals are given. The first is based on the exact distribution of Pearson's correlation. The second is based on Fisher's z transformation which approximates the exact distribution using the normal distribution. Why are both provided? Because most books only mention Fisher's approximate method, it will often be needed to do homework. However, the exact methods should be used whenever possible.

The confidence limits can be used to test hypotheses about the correlation. To test the hypothesis that rho is a specific value, say r_0 , check to see if r_0 is between the confidence limits. If it is, the null hypothesis that $\rho = r_0$ is not rejected. If r_0 is outside the limits, the null hypothesis is rejected.

Spearman's Rank correlation is calculated by replacing the original data with their ranks. This correlation is used when some of the assumptions may be invalid.

Summary Matrices

	X'X	X'X	X'Y	X'X Inverse	X'X Inverse
Index	0	1	2	0	1
0	10	361	20607	1.307906	-0.03346001
1	361	14111	775216	-0.03346001	0.00092687
2 (Y'Y)			4.366524E+07		
Determinant		10789			9.2687E-05

Variance - Covariance Matrix of Regression Coefficients

	VC(b)	VC(b)
Index	0	1
0	47765.29	-1221.974
1	-1221.974	33.84968

Tests of Assumptions Section

Assumption/Test	Test Value	Prob Level	Is the Assumption Reasonable at the 0.2000 Level of Significance?
Residuals follow Normal Distribution?			
Shapiro Wilk	0.9841	0.983426	Yes
Anderson Darling	0.1650	0.941578	Yes
D'Agostino Skewness	-0.0542	0.956804	Yes
D'Agostino Kurtosis	-0.2002	0.841320	Yes
D'Agostino Omnibus	0.0430	0.978722	Yes
Constant Residual Variance?			
Modified Levene Test	2.5538	0.148699	No
Relationship is a Straight Line?			
Lack of Linear Fit F(6, 2) Test	7491.0355	0.000133	No

No Serial Correlation?

Evaluate the Serial-Correlation report and the Durbin-Watson test if you have equal-spaced, time series data.

Notes:

A 'Yes' means there is not enough evidence to make this assumption seem unreasonable. This lack of evidence may be because the sample size is too small, the assumptions of the test itself are not met, or the assumption is valid.

A 'No' means the that the assumption is not reasonable. However, since these tests are related to sample size, you should assess the role of sample size in the tests by also evaluating the appropriate plots and graphs. A large dataset (say $N > 500$) will often fail at least one of the normality tests because it is hard to find a large dataset that is perfectly normal.

Normality and Constant Residual Variance:

Possible remedies for the failure of these assumptions include using a transformation of Y such as the log or square root, correcting data-recording errors found by looking into outliers, adding additional independent variables, using robust regression, or using bootstrap methods.

Straight-Line:

Possible remedies for the failure of this assumption include using nonlinear regression or polynomial regression.
